

Data2CRM™

Take the **frustration** out of data migration

Fun. Fast. Forgiving. Not 3 words you would normally think of when you do data imports and migrations. You will after you use Data2CRM™.

Data2CRM is a visually intuitive data import and migration tool that redefines the user experience for moving data into Microsoft Dynamics CRM 4.0.

Data2CRM is offered as a Software+Services solution where CRM Innovation hosts all the technology necessary to create the data map, process the import and report on the results. There is no code you need to install or manage on your CRM server or client.

This solution works with all implementation scenarios of CRM 4.0 - Online, On premise & Partner Hosted. Because we have created a non-technical approach to getting data into CRM, it is so easy even your boss could do it. And if you are the boss you won't have to hire a programmer to do it.

We have redefined the user experience with an intuitive visual interface.

- Using the visual tools, map target and source fields using the drag and drop technology that brings back a look-a-like of the CRM form.
- Preflight the import and see the data exactly how it will appear in a real CRM form.
- Edit your source data within the system to correct errors before the import not after.
- No more remembering those 'pesky' schema names, work with the form just as you would see it in CRM.
- No more 'do-overs', Preflight the import - we check the source data against the actual CRM attribute parameters to make sure it will fit before you do the actual import.

On-Premise On-Line
Silverlight Drag & Drop
Partner-Hosted Software+Services
Relationships Transformations
Preview Preflight Duplicate Detection
